(54) A thickening agent and cosmetic compositions containing it

(57) A gelling or thickening agent is produced from the ionic interaction of:

a cationic polymer comprising a polymer of a cellulose, or a cellulose derivative, which is grafted with a quaternary ammonium salt of a water-soluble monomer, and

a carboxylic anionic polymer having a specified capillary viscosity and Epprecht-Drage viscosity.

The anionic polymer may be polymethacrylic acid, a copolymer of methacrylic acid with an alkyl acrylate or methacrylate, an acrylamide derivative, maleic acid, a monoalkyl maleate or N-vinyl pyrrolidone, or an ethylene-maleic anhydride copolymer.

The agent is incorporated in compositions for treating the hair, skin or nails e.g. hair rinsing or setting lotions, shampoos, anti dandruff compositions, anti seborrhoeic compositions, support gels for permanent waving, hair dyeing compositions, anti-acne compositions and antipsoriatic compositions.

SPECIFICATION

A thickening agent and cosmetic compositions containing it

5 The present invention relates to a new gelling or thickening agent, new thickened or gelled cosmetic compositions containing such an agent and a process enabling cosmetic compositions to be gelled and/or thickened. A general requirement existing in the cosmetics industry is for compositions for hair or for the skin which do not flow too quickly; such is the case, in particular, with the compositions 10 employed in processes which involve periods of application or of contact of the composition 10 with the hair or the skin. It is very advantageous, in this case, to employ compositions which have a viscosity index higher than a certain limit enabling the products to be properly localized with the aid of thickened solutions. In previous patents such as French Patents 2,383,660, 2,505,179 and 2,542,997, we have 15 already described compositions containing cationic polymers and anionic polymers in an aqueous medium capable of being presented in the form of thickened or gelled compositions. The polymers are employed in these compositions in order to impart to hair advantageous shaperetention, sheen and disentangling properties. These compositions are optionally thickened with a gelling or thickening agent which is added to the polymers. Such gelled or thickened compositions of the prior art have the disadvantage, however, 20 resulting from the presence of the gelling or thickening agents, of excessively loading the hair or of leaving an unattractive powdery deposit or, yet again, of imparting to it an unpleasant feel or a dull appearance, particularly when involving compositions whose application is not followed by These compositions, which contain a gelling or thickening agent in addition to the polymers, 25 are sometimes cloudy or opaque, and this can prevent their use in certain applications such as, for example, hair-shaping compositions which are generally clear. We have investigated the possibility of preparing gelled or thickened aqueous cosmetic compositions conferring onto hair the advantageous shape-retention and sheen properties of the 30 compositions containing cationic and anionic polymers, while avoiding the abovementioned disadvantages due to the addition of gelling agents or thickeners. It is known to form gels from a polymer derived from a quaternary ammonium of cellulose ether as described in US-A-3,472,840 and from an anionic polymer which is alginic acid or a polysulphonic acid such as 2-acrylamido-2-methylpropanesulphonic acid. The gelled compositions 35 produced in this manner result, on the one hand, from the use of anionic polymers which 35 themselves have thickening or gelling properties and, furthermore, require relatively high solids concentrations. Furthermore, such compositions are not completely satisfactory when they are employed for conditioning hair damaged by physical or chemical treatments or by atmospheric agents. We have found that it is possible to prepare aqueous cosmetic compositions which are gelled or thickened by a copolymer of cellulose or of a cellulose derivative which are grafted by a radical route with a quaternary ammonium salt of a water-soluble monomer with certain carboxylic anionic polymers. This synergistic effect appears to be due, though this is merely a hypothesis, to the formation of an interpolymer by ionic interaction in an aqueous medium. To make the 45 definition easier, the term "thickener" or "thickening agent" is employed in the remainder of the 45 specification to denote a product having thickening and/or gelling properties resulting from this The formation of a thickening agent is particularly surprising insofer as it results from polymers which do not individually have the thickening properties of the resulting agent. This capacity is 50 markedly superior to that of gels known previously, some of which have been produced using 50 anionic polymers which themselves have gelling properties. This is particularly advantageous within the scope of the present invention because the thickening characteristics make it possible not only to achieve a saving in the use of the polymers to obtain an identical gelling but at the same time make it possible to impart to the hair or to the skin, which are treated with these 55 compositions, certain improved cosmetic properties without loading the hair excessively. The cosmetic compositions containing the thickening agent have the advantage of not loading the hair, even when the applications are repeated, especially in the case of compositions which are applied using methods which do not involve a rinsing stage, and of imparting a pleasant feel and a gleaming appearance to the hair. They impart good shape retention and good liveliness to

60 hair, and more particularly to fine hair, in the case of the compositions whose application is

followed by a water rinse. Lastly, these compositions make it possible to improve the treatment of damaged hair, especially insofar as its disentangling, its softness and its feel are concerned. The subject of the present invention concerns a thickener resulting from an ionic interaction in an aqueous medium of a copolymer of a cellulose or a cellulose derivative grafted by a radical for the following form the following form the following from the following form the following following forms of the following fo

O

.2	GB2 193501A	∠.
<u> </u>		
•	carboxylic anionic polymers. The present invention provides a gelling or thickening agent produced from the ionic interac-	
	tion of: a cationic polymer comprising a polymer of cellulose or a cellulose derivative which are grafted	
5	with a quaternary ammonium salt of a water-soluble monomer, and	5
	a carboxylic anionic polymer having an absolute capillary viscosity, at a concentration of 5% in dimethylformamide or methanol at 30°C, of lower than or equal to 30×10 ⁻³ Pa s, this thickener	•
	having an Epprecht-Drage viscosity, module 3, of at least 0.45 Pa s in solution at a concentra-	•
40	tion of 1% in water at 21°C.	10
10	The ionic interaction is preferably carried out in an aqueous medium and the grafting is preferably carried out by a radical route. The cationic polymer preferably has an absolute	10
•	capillary viscosity at 1% in water at 30°C of less than 0.025 Pa s.	•
	The cationic polymer is preferably a cellulose, or hydroxyalkyl cellulose such as hydroxymethyl cellulose, hydroxyethyl cellulose or hydroxypropyl cellulose which are grafted by a radical route	
15	with a methacryloylethyltrimethylammonium, methacrylamidopropyltrimethylammonium or dime-	15
	thyldiallylammonium salt, more particularly a halide such as a chloride, or a methosulphate.	
	A particularly preferred cationic polymer is a hydroxyethyl cellulose copolymer grafted by a radical route with diallyldimethylammonium chloride sold under the trade name "Celquat L 200"	
	or "Celquat H 100" by National Starch, which is also called "Polyquaternium 4" in the CFTA	20
20	dictionary. When diluted to a concentration of 1% in water at a temperature of 30°C, this polymer has an absolute capillary viscosity of the order of 0.01 Pa s in the case of the product	20
	marketed under the trade name "Celquat L 200" or of 0.021 Pa s in the case of the product	
	marketed under the trade name "Celquat H 100". The carboxylic anionic polymer preferably has a molecular weight of from 500 to 3,000,000	
25	more particularly from 1,000 to 3,000,000. It is preferably a film-forming polymer.	25
	Particularly preferred polymers are: (a) a methacrylic acid homopolymer which has a molecular weight of greater than 20,000, as	
	determined by light scattering.	
	(b) a copolymer of methacrylic acid with one of the following monomers:	20
30	C ₁ -C ₄ alkyl acrylate or methacrylate; an acrylamide derivative, such as N,N-dimethylacrylamide, diacetoneacrylamide or N-tert-butyla-	30
	crylamide;	
	maleic acid; C ₁ -C ₄ monoalkyl maleate; or	
35	N-vinylpyrrolidone; or	35
	(c) a copolymer of ethylene with maleic anhydride, such as the product sold under the trade name EMA 31 by Monsanto Cie.	
	Particularly preferred anionic polymers are methacrylic acid copolymers which have an absolute	•
40	capillary viscosity measured at a concentration of 5% in solution in dimethylformamide or	40
40	methanol, at 30°C, of from 0.003 to 0.030 Pa s, more particularly a copolymer of methacrylic acid with methyl methacrylate whose absolute capillary viscosity, measured at a concentration of	70
	5% in solution in dimethylformamide, is of the order of 0.015 Pa s or a copolymer of metha-	
	crylic acid with monoethyl maleate which has an absolute capillary viscosity, measured at a concentration of 5% in solution in dimethylformamide, of the order of 0.013 Pa s, a copolymer	
45	of methacrylic acid with butyl methacrylate whose absolute capillary viscosity, measured at a	45
	concentration of 5% in solution in methanol, is of the order of 0.010 Pa s, or a copolymer of methacrylic acid with maleic acid whose absolute capillary viscosity, measured at a concentration	
	of 5% in solution in dimethylformamide, is of the order of 0.016 Pa s.	
50	The thickener may, for example, be prepared under the following conditions: a quantity of water is added to the copolymer of cellulose or cellulose derivative grafted by a	50
50	radical route with a quaternary ammonium salt of a water-soluble monomer to dissolve it	00
	(solution 1).	
	Separately, a quantity of water is added to the carboxylic anionic polymer to dissolve it, the dissolution being promoted by neutralization with a conventional alkalifying agent such as aque-	,
55	ous ammonia or an alkanolamine (solution II).	55
	The thickener may then be formed by adding solution I to solution II or vice versa, with	
	stirring, at ambient temperature. When the gelling or thickening agent has formed it can then, if desired, be diluted with water or with a mixture of water and alcohol, the proportion of alcohol	
	being that required to produce the required alcoholic strength for the formulation.	60
60	According to an alternative form of this process, it is equally possible, without recourse to neutralization, to dissolve the carboxylic anionic polymer in alcohol, preferably ethanol, at a	60
	concentration such as to bring the final formulation to the alcoholic strength required.	
,	The thickener may also be formed in the aqueous cosmetic medium itself. The copolymer of cellulose or a cellulose derivative which are grafted with a quaternary	
65	ammonium salt is preferably used in an aqueous medium, generally in an amount of from 0.01	65

GB 2 193 501 A 3

to 6%, especially 0.1 to 1.5%, by weight relative to the weight of the composition. The carboxylic anionic polymer is preferably used in an aqueous medium, generally in an amount of from 0.01 to 6%, especially 0.1 to 1.5%, by weight relative to the weight of the composition. The Weight ratio of the cationic polymer to the carboxylic anionic polymer is preferably from 1:5 to 5:1, more preferably from 1:2 to 2:1 and is especially equal to about 1:1. The present invention also provides a cosmetic composition suitable for the treatment of hair, skin or nails which comprises at least one gelling or thickening agent as defined above and at least one further adjuvant. The thickener is preferably present in the composition of the present invention in a concentra-10 tion of from 0.02 to 12%, more preferably from 0.2 to 3%, by weight based on the total 10 weight of the composition. This composition is generally in aqueous form, but may contain other cosmetically acceptable solvents such as, for example, lower (for example C1-C8 or C1-C4) alcohols such as ethanol or isopropanol, glycerol, glycols or glycol ethers such as ethylene glycol monobutyl ether, propylene 15 glycol, diethylene glycol monoethyl ether and monomethyl ether, in proportions which do not affect the formation of the thickener. These compositions have a pH which is generally from 6 to 12, preferably from 6.5 to 9, more particularly, close to neutrality, for example of the order of 7 to 8. The pH may be adjusted with an alkalifying or acidifying agent which is usually employed in 20 the field of cosmetics. 20 The cosmetic composition may, for example, be employed as a shampoo, after-shampoo composition, product for rinsing to be applied before or after shampooing, before or after dyeing or bleaching, before or after permanent-waving or hair straightening, a hair-setting or blow-drying composition, a restructuring composition, or a support for permanent-waving or for dyeing or 25 25 bleaching hair. The composition may also contain a dermatological active principle such as an antidandruff, antiseborrhoeic, antiacne, antifungal, bactericidal, keratolytic or antipsoriatic agent. When the composition is in the form of a thickened lotion or gel for hair-setting or for blowdrying, it may optionally contain other polymers which are usually employed in a composition of this type, more particularly nonionic polymers such as polyvinylpyrrolidones, copolymers of 30 polyvinylpyrrolidone with vinyl acetate, or anionic polymers which do not have the abovemen-30 tioned properties of gelling or thickening with the cationic polymer, for example copolymers of vinyl acetate with an unsaturated carboxylic acid such as crotonic acid, copolymers resulting from the copolymerization of vinyl acetate with crotonic acid and an acrylic or methacrylic ester, copolymers resulting from the copolymerization of vinyl acetate with an alkyl vinyl ether and an 35 35 unsaturated carboxylic acid and copolymers resulting from the copolymerization of vinyl acetate with crotonic acid and a vinyl ester of an acid containing a long carbon chain or an allyl or methallyl ester of an acid containing a long carbon chain. These polymers are generally employed in a concentration of from 0.1 to 5% by weight based on the total weight of the composition. 40 When employed as a rinsing composition, the composition may contain various conditioning agents such as quaternary proteins, cationic silicone polymers, cationic surfactants and cationic polymers other than polymers of cellulose or of cellulose derivatives grafted by a radical route with a quaternary ammonium water-soluble monomer, of the polyamine, polyaminoamide or quaternary polyammonium type. When the compositions are employed as shampoos, they may contain surface-active agents with detergent properties which are known per se, such as anionic, cationic, nonionic or amphoteric surface-active agents or mixtures thereof. In general, the surface-active agents are present in a proportion of from 0.1 to 30% by weight based on the total weight of the composition. 50 When the composition is employed for dyeing hair, it may contain a direct dye or oxidation dve precursor which is known in the art. The compositions may also be used for conditioning skin and nails. A particularly perferred cosmetic composition is a hair-shaping composition which is not rinsed off. This composition comprises, in an aqueous or aqueous-alcoholic medium, a thickener result-55 55 ing from the ionic interaction of 0.1 to 1.5% by weight of a hydroxyethyl cellulose copolymer grafted by a radical route with diallyldimethylammonium chloride and 0.1 to 1.5% by weight of a copolymer of methacrylic acid with methylmethacrylate or with monoethyl maleate or with butyl methacrylate whose absolute capillary viscosity, measured at 30°C in solution in dimethylformamide or methanol at a concentration of 5%, is from 0.010 to 0.015 Pa s, the Epprecht-Drage 60 60 viscosity of the thickener, measured at 21°C, module 3, diluted to a concentration of 1% in water, being higher than 0.45 Pa s, and the pH of the composition being from 6.5 to 9. The compositions according to the invention may contain any other ingredient which is usually employed in cosmetics, such as perfumes, colourants, preservatives, sequestering agents, softeners or silicones. The present invention also provides a process for thickening or gelling a cosmetic composition

25

wherein at least one thickener as defined above or a composition containing the polymers forming the thickener in a proportion of from 0.02 to 12% by weight based on the total weight of the composition is introduced into the composition to give it an Epprecht-Drage viscosity, measured at 21°C (module 3), of at least 0.450 Pa s.

Aqueous gels or thickened compositions containing the thickener may be prepared separately, and the cosmetic composition may be prepared in a different step, if desired at the time of use. The present invention also provides a process for the treatment of hair, of the skin and of the

nails, wherein a cosmetic composition as defined above is applied thereto, it being possible for this composition to be rinsed off with water, or not, according to the nature of the treatment 10 desired.

We have found that the composition for the treatment of hair not only makes it possible to localize the product on hair properly without flowing onto the face but that the hair treated in this manner also has a pleasant feel and a shiny appearance. Furthermore, the thickened or gelled composition has the advantage of being clear.

15 The examples which follow further illustrate the invention.

EXAMPLE 1

Aqueous gels were prepared according to the information which appears in Table A which follows. For this purpose 50 cm³ of an aqueous solution containing 1% of active substance of 20 the product marketed under the trade name of "Celquat L 200", which is a copolymer of 20 hydroxyethyl cellulose grafted by a radical route with diallyldimethylammonium chloride, were added at ambient temperature and with mechanical stirring to 50 cm³ of an ethanolic solution at an alcohol strength of 20° containing 1% as active substance of the previously neutralized anionic polymer defined in the table.

In Table A below, the measurement of the absolute capillary viscosity of the anionic polymers is carried out in dimethylformamide (DMF) and/or in methanol.

EXAMPLES 2 to 11

The following gelled compositions for hair styling are prepared (Tables B and C).

When these various compositions are applied to clean wet hair, they impart shape retention to it without leaving a powdery deposit. When they are applied to dried hair it is found that the composition makes styling easier without loading the hair and that, once dried, the latter is soft and has a pleasant feel.

	EXAMPLE 22	lan in managad by ad	dink E a at hammed a consider at the state	
	of use to the gel whose composit		ding 5 g of benzoyl peroxide at the time	
20	The composition is applied to the		6	20
		1		
	EXAMPLE 23		•	
	The following bactericidal compo	sition is prepared by	adding 1 g of 5-chloro-2-(2,4-dichloro-	•
25	to the gel whose composition is g		of "Irgasan DP 300" at the time of use	25
25	This composition is applied to the		1	. 25
	The competition is applied to a	10 UKI/I.		
	EXAMPLE 24			
	A hair-conditioning composition	is prepared by adding	18 g of iris powder diluted with 36 g	
30	of water to 46 g of a gel of the fo		. '	30
	(A) Celquat L 200	4.5	g	
	(B) 80/20 Methacrylic acid/N-viny copolymer	4.5	g	
		s. 10°	9	
35	2-Amino-2-methyl-1-propanol qu	s. pH 7.5		.35
	Perfume, preservative q.		•	
	Water q.	s. 100	g	
	The composition is applied to w	ashed hair. After rinsi	ng, the hair has a soft feel.	
40	The gel obtained by interaction of	of the polymers A and	B has an Epprecht-Drage viscosity at	40
•	21°C, module 4, of 11.7 Pa s at a	concentration of 9%	in water.	
	EVANDLE 25	•		*
	EXAMPLE 25 The following restructuring ripsin	a lation is propared b	y adding 1.5 g of dimethylolethylenethi-	
45	ourea at the time of use to the ge	of Example 21 at pH	y adding 1.5 g or dimethylolethylenethi-	45
40	This composition is applied to di		· · ·	70
	CLAIMS			
	1. A gelling or thickening agent			
50	a cationic polymer comprising a grafted with a quaternary ammoniu		or a cellulose derivative which are	50
			ry viscosity, at a concentration of 5% in	
			or equal to 30×10^{-3} Pa s, this thickener	•
			t 0.45 Pa s in solution at a concentra-	•
- 55	tion of 1% in water at 21°C.			55
	2. An agent according to claim	1 wherein the cationic	polymer is a hydroxyalkyl cellulose	
	copolymer grafted by a radical roun	e wπn a quaternary a	mmonium sait of a water-soluble n, methacrylamidopropyltrimethylammon-	
	ium or dimethyldiallylammonium sa		i, methacrylamidopropytumethylammon-	
60	3. An agent according to claim		arboxylic anionic polymer is:	60
	a methacrylic acid homopolymer		eight greater than 20,000, as determined	
	by light scattering,			
			ylate or methacrylate, an acrylamide	
65	derivative, maleic acid, a C ₁ -C ₄ mo a copolymer of ethylene with ma		ingipyrrollaone, or	65
-		winipoliuoi		

•	4. An agent according to any one of claims 1 to 3 wherein the anionic polymer is: a copolymer of methacrylic acid with methyl methacrylate whose absolute capillary viscosity, measured in solution in dimethylformamide at a concentration of 5% at 30°C, is of the order of 15 x 10 ⁻³ Pa s,	,
ŧ	a copolymer of methacrylic acid with monoethyl maleate having an absolute capillary viscosity, measured in solution in dimethylformamide at a concentration of 5% at 30°C, of the order of 13×10 ⁻³ Pa s,	. 5
10	a copolymer of methacrylic acid with butyl methacrylate whose absolute capillary viscosity, measured in solution in methanol at a concentration of 5% at 30°C, is of the order of 10×10 ⁻³ . Pas, or a copolymer of methacrylic acid with maleic acid whose absolute capillary viscosity, measured in solution in dimethylformamide at a concentration of 5% at 30°C, is of the order of 16×10 ⁻¹ .	10
15	Pa s. 5. An agent according to any one of claims 1 to 4 wherein the weight ratio of the cationic polymer to the carboxylic anionic polymer is from 1:5 to 5:1. 6. An agent according to any one of claims 1 to 5 which has been prepared in an aqueous medium comprising 0.01 to 6% of the cationic polymer and 0.01 to 6% of the carboxylic anionic polymer.	15
20	7. An agent according to claim 1 substantially as hereinbefore described with reference to any one of the Examples. 8. A cosmetic composition suitable for the treatment of hair, skin or nails, which comprises	20
25	at least one gelling or thickening agent as defined in any one of claims 1 to 7 and at least one further adjuvant. 9. A composition according to claim 8 wherein the gelling or thickening agent is present in a	
. 25	proportion of from 0.02 to 12% by weight based on the total weight of the composition. 10. A composition according to claim 8 or 9, which has a pH of from 6 to 12. 11. A composition according to any one of claims 8 to 10 suitable for use as a thickened or gelled lotion for hair-setting or for blow-drying which additionally comprises a nonionic polymer	25
30	which is a polyvinylpyrrolidone or copolymer or polyvinylpyrrolidone with vinyl acetate, or an an anionic polymer which is a copolymer of vinyl acetate with an unsaturated carboxylic acid, a copolymer resulting from the polymerization of vinyl acetate with crotonic acid and an acrylic or methacrylic ester, a copolymer resulting from the copolymerization of vinyl acetate with a vinyl alkyl ether and an unsaturated carboxylic acid, a copolymer resulting from the copolymerization	30
35	of vinyl acetate with crotonic acid and a vinyl ester of an acid containing a long carbon chain or an allyl or methallyl ester of an acid containing a long carbon chain. 12. A composition according to any one of claims 8 to 11 in the form of a shampoo which comprises one or more anionic, cationic, nonionic or amphoteric surface-active agents with a detergent property.	35
40	13. A composition according to any one of claims 8 to 10, suitable for rinsing off, which comprises a conditioning agent which is a quaternary protein, cationic silicone polymer, cationic surfactant or cationic polymer other than a polymer of a cellulose or cellulose derivative grafted by a radical route with a quaternary ammonium water-soluble monomer.	40
45	14. A cosmetic composition suitable for use in hair-setting, which comprises, in an aqueous or aqueous-alcoholic medium, a thickener resulting from the ionic interaction of 0.1 to 1.5% by weight of a hydroxyethyl cellulose copolymer grafted by a radical route with diallyldimethylammonium chloride and 0.1 to 1.5% by weight of a copolymer of methacrylic acid with methyl	45
50	methacrylate or with monoethyl maleate or with butyl methacrylate whose absolute capillary viscosity, measured at 30°C in solution in dimethylformamide or methanol at a concentration of 5%, is from 0.010 to 0.015 Pa s, the Epprecht-Drage viscosity of the thickener, measured at 21°C, module 3, diluted to a concentration of 1% in water, being higher than 0.45 Pa s, and the	50
	pH of the composition being from 6.5 to 9. 15. A cosmetic composition according to claim 8 or 14 substantially as hereinbefore described with reference to any one of the Examples. 16. A process for thickening or gelling an aqueous cosmetic composition wherein at least	
. 55	one thickener as defined in any one of claims 1 to 7 is introduced into the composition to give it an Epprecht-Drage viscosity measured at 21°C (module 3) of at least 0.45 Pa s at a concentration of 1% in water.	55
60	 17. A process for the treatment of hair, of the skin or of the nails, wherein at least one cosmetic composition as defined in any one of claims 8 to 15 or produced by a process as defined in claim 16 is applied thereto. 18. A process according to claim 17 wherein a composition as defined in claim 11 or 14 is applied, this application not being followed by a rinse. 	60
